EXAMINER'S AMENDMENT

Oath/Declaration

1. The oath or declaration is defective. A new oath or declaration in compliance with 37 CFR 1.67(a) identifying this application by application number and filing date is required. See MPEP §§ 602.01 and 602.02.

The oath or declaration is defective because:
the foreign application having a filing date before that of the application on which priority is claimed, by specifying the application number, country, day, month and year of its filing has the wrong year – it should be 2003.

2. Applicant is now required to submit a substitute declaration or oath to correct the deficiencies set forth above. The substitute oath or declaration must be filed within the THREE MONTH shortened statutory period set for reply in the “Notice of Allowability” (PTO-37). Extensions of time may NOT be obtained under the provisions of 37 CFR 1.136. Failure to timely file the substitute declaration (or oath) will result in **ABANDONMENT** of the application. The transmittal letter accompanying the declaration (or oath) should indicate the date of the “Notice of Allowance” (PTOL-85) and the application number in the upper right hand corner.

REASONS FOR ALLOWANCE

3. The following is an examiner's statement of reasons for allowance: the prior art of record do not fairly teach in permissible combination the claimed invention: “A shut-off system for the avoidance of an overspeed condition in the event of a respective shaft failure, comprising: a coaxial reference shaft connectable to an energy-consuming end of

the respective shaft; a signal trip element attached to the reference shaft and being axially and rotatably located on an energy-generating end of the respective shaft; at least one loading item exerting an axial force on the signal trip element; *at least one driver pin protruding radially from a periphery of the signal trip element; at least one latch engageable with the at least one driver pin to hold the signal trip element in a releasable locking position; and at least one laterally facing rotary driver attached to the energy-generating end of the respective shaft which, upon a failure of the respective shaft and a corresponding relative rotation of the reference shaft to the respective shaft, rotatably engages the at least one driver pin to disengage the at least one driver pin from the at least one latch and release the signal trip element from the locking position to enable the signal trip element to move axially towards at least one of a sensor or an electric switching element arranged axially opposite of the signal trip element to generate a signal to an electronic control to interrupt an energy supply to the respective shaft.*”

Note that Alexander et al (3,032,985) teach a speed responsive governor to actuate a fuel control lever 132 but does not employ the claimed italicized arrangement nor the coaxial reference shaft connectable to an energy-consuming end of the respective shaft. Rather the shaft 60 is connected by a takeoff shaft 46, 48 to the shaft of the turbine. King (4,473,998) teaches a mechanical system to control the fuel shut off valve via 78 but does not teach the italicized text.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably

accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
